

Cross-environment generalization of STDW (4 hulls x 3 sea states)

Full-trajectory tracking-MSE change

Post-drift tail error change (5s-RMS filtered)

Negative (blue) = improvement. STDW compresses tracking error on base / long-body / heavy hulls across all spectra (full-traj mean -21%, tail mean -42%), but collapses on asymmetric hulls without active routing (resolved by OPR, Slide 10). Left = whole-episode raw MSE; right = stationary post-drift filtered error.

Source: *sweep_a3_stage2_detref_20260619_223735 | policy_model_2398 (stage2 2026-06-08), deterministic_reference shared-trajectory re-run. Full = whole-episode raw tracking-MSE; Tail = post-drift (step>1200) 5s-RMS filtered error (final_mse_after_drift), the project-standard adaptation metric.*
